

IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

In re patent application of:

FAHEY

Confirmation No. 6750

Application No. 10/532,213

Art Unit: 2174

Filed: April 22, 2005

Examiner: LEE, Jinhee J.

For: **ELECTRICAL WIRING FOR BUILDINGS**

PETITION FOR EXTENSION OF TIME UNDER 37 CFR §1.136

MS AF
Commissioner for Patents
P.O. Box 1450
Alexandria, VA 22313-1450

Sir:

Pursuant to 37 CFR §§1.17 and 1.136, Applicant hereby petitions for a two-month extension of time to respond to the Office Action dated February 22, 2007. With a two-month extension of time, the time period for reply is set to expire on July 22, 2006. A check in the amount of \$225.00 for the extension-of-time fee under 37 C.F.R. §1.17(a) is enclosed.

If extensions of time other than those provided herewith are required to allow consideration of papers accompanying this Petition, then such extensions of time are hereby petitioned. The Commissioner is specifically authorized to charge any fee deficiency or credit any overpayment to Deposit Account No. 14-0112.

Respectfully submitted,

THE NATH LAW GROUP

Date: July 13, 2007

appropriately inserted into the female socket and provide an electrical supply providing an active connection and a neutral connection.

22. (New) A loom as recited in claim 21 wherein said loom has ends which are bared so as to connect to a traditional connector block.

23. (New) A loom as recited in claim 21 further comprising a connector in conjunction with the loom having at one end a plug and at a further end a socket of a type adapted to be fixed into a position as an accessible socket for a user of a building.

24. (New) A loom as recited in claim 23 wherein said connector includes a switch to open or close connection thereof to the loom.

25. (New) A loom for wiring of an electrical power supply for a building from a mains switched supply location,

there being at least one cable having at least six separately insulated electrically conducting cores being at least a first core, a second core, a third core, a fourth core, a fifth core and a sixth core, the cores collectively being held together for a substantial length of the cable,

there being at spaced apart locations along said substantial length of cable a plurality of sockets, being a first set of sockets, with for each location at least one female socket of the first set with electrically conducting contacts within the socket one of which contacts is electrically connected to the first core, and a second of which contacts is connected to the second core, each socket being electrically arranged to provide an electrical supply to a male plug when

appropriately inserted into the female socket and provide an electrical supply providing an active connection and a neutral connection,

there being, also at spaced apart locations along the length of the cable a plurality of sockets being a second set with for each location at least one female socket with electrically conducting contacts within each of the sockets of the second set one of which contacts is electrically connected to the third core, and a second of which contacts is connected to the fourth core, each socket being electrically arranged to provide an electrical supply to a male plug when appropriately inserted into the female socket and provide an electrical supply providing an active connection and a neutral connection, and

there being, also at spaced apart locations along the length of the cable a plurality of sockets with for each location at least one female socket being of a third set of sockets being a third set of sockets with electrically conducting contacts within each of the sockets of the third set one of which contacts is electrically connected to the fifth core, and a second of which contacts is connected to the sixth core, each socket being electrically arranged to provide an electrical supply to a male plug when appropriately inserted into the female socket and provide an electrical supply providing an active connection and a neutral connection.

26. (New) A loom as recited in claim 25 wherein said loom has ends which are bared so as to connect to a traditional connector block.

27. (New) A loom as recited in claim 25 further comprising a connector in conjunction with the loom having at one end a plug and at a further end a socket of a type adapted to be fixed into a position as an accessible socket for a user of a building.

28. (New) A loom as recited in claim 27 wherein said connector includes a switch to open or close connection thereof to the loom.

29. (New) A loom for wiring of an electrical power supply for a building from a mains switched supply location,

there being at least one cable having at least seven separately insulated electrically conducting cores being at least a first core, a second core, a third core, a fourth core, a fifth core, a sixth core, and a seventh core the cores collectively being held together for a substantial length of the cable,

there being at spaced apart locations along said substantial length of cable a plurality of sockets, being a first set of sockets, with for each location at least one female socket of the first set with electrically conducting contacts within the socket one of which contacts is electrically connected to the first core, and a second of which contacts is connected to the second core, and a third of which is connected to the seventh core, each socket being electrically arranged to provide an electrical supply to a male plug when appropriately inserted into the female socket and provide an electrical supply providing an active connection, a neutral connection, and an earth connection with the seventh core,

there being, also at spaced apart locations along the length of the cable a plurality of sockets being a second set with for each location at least one female socket with electrically conducting contacts within each of the sockets of the second set one of which contacts is electrically connected to the third core, and a second of which contacts is connected to the fourth core, and a third of which is connected to the seventh core, each socket being electrically arranged to provide an electrical supply to a male plug when appropriately inserted into the

female socket and provide an electrical supply providing an active connection, a neutral connection, and an earth return with its connection to the seventh core and

there being, also at spaced apart locations along the length of the cable a plurality of sockets with for each location at least one female socket being of a third set of sockets being a third set of sockets with electrically conducting contacts within each of the sockets of the third set one of which contacts is electrically connected to the fifth core, a second of which contacts is connected to the sixth core, and a third of which is connected to the seventh core, each socket being electrically arranged to provide an electrical supply to a male plug when appropriately inserted into the female socket and provide an electrical supply providing an active connection and a neutral connection and an earth return.

30. (New) A loom as recited in claim 29 wherein said loom has ends which are bared so as to connect to a traditional connector block.

31. (New) A loom as recited in claim 29 further comprising a connector in conjunction with the loom having at one end a plug and at a further end a socket of a type adapted to be fixed into a position as an accessible socket for a user of a building.

32. (New) A loom as recited in claim 31 wherein said connector includes a switch to open or close connection thereof to the loom.
